

Delivery Route Planner User Guide

Introduction

RouteMaster Pro is an intelligent delivery route planner designed to optimise multi-stop journeys in real time. By calculating the fastest paths and most efficient stop orders, it helps cut mileage, reduce fuel spend by up to 30%, and keeps your drivers on track with turn-by-turn guidance.

Key Features

- **Fastest-Path Routing:** Automatically calculates the most efficient route between multiple points.
- **Via Points:** Add multiple stops to a single journey.
- **Custom Locations:** Save frequently visited addresses for quick selection.
- **Turn-by-Turn Guidance:** Clear directions for drivers to follow.

Getting Started

1. Planning a Route

On the main screen, you will see inputs for your journey:

- **Point A (Start):** Enter the starting address or postcode.
- **Point B (Destination):** Enter the final destination.
- **Add Via Point:** Click this button to add intermediate stops. You can add multiple via points for a complex delivery run.

2. Using Saved Locations

Instead of typing full addresses, you can click into any location field and select from your saved locations (e.g., 'Home', 'Warehouse A', 'Singleton Hospital').

3. Starting Navigation

Once all points are entered, click **Start Navigation**. The system will calculate the optimal route, display it on the interactive map on the right, and generate **Turn-by-Turn Guidance** in the panel on the left.

4. Managing Custom Locations

Click the **Manage Locations** button at the top right to open the location manager.

- **Add New Location:** Enter a memorable name and the full address/city, then click Save.
- **Saved Locations:** View, edit, or delete your existing saved addresses. Keeping this list updated speeds up daily route planning.

5. Printing the Route

For drivers who require physical copies, or as a backup, click **Print Route**. This will format the map and the turn-by-turn directions into a clean, printer-friendly layout.
